

10590-712(8) Lagrangian- and Hamiltonian Mechanics (1 1/2 I, 1 1/2p)

2014

Course summary:

Degrees of freedom, generalised co-ordinates, Lagrange equations of the first and second kind, applications, small oscillations, variational calculus, Hamilton's principle, Noether's theorem.

Outcomes of course:

This course skills the student in the techniques and use of Lagrangian- and Hamiltonian Mechanics. Legendre transformations and the variational principle.

Emphasis is placed on problem solving. This course is the basis of all further courses in classical mechanics and also lays the foundation for more advanced courses in quantum mechanics.

Lecturer:

Prof BIS van der Ventel
Telephone number: (021) 808-3388
E-mail address: bventel@sun.ac.za
Office: Room 1019, Merensky Physics Building.

Course content:

The formulation of classical mechanics from a very general viewpoint in terms of generalized coordinates etc; conservation laws and their relation with Hamilton and Lagrange formalisms and symmetries; the analyses and approximation of many-body systems through normal modes; Lagrange and Hamilton mechanics as a formal basis of quantum mechanics.

Practical (Tutorials):

Wednesday 09h00 till 11h00

Study material

Notes will be sent via email to all students
Additional textbooks will be placed on reserve in the Physics library

Learning opportunities:

Lectures
Tutorials

Assessment:

Methods of Assessments

Continuous Evaluation: Two test and two homework assignments

Venue and time of assessment opportunities

To be announced in class.

Availability of marks:

In reasonable time

Calculation of final mark for the module:

Final mark = $0.25 \cdot (\text{Test 1}) + 0.25 \cdot (\text{Test 2}) + 0.25 \cdot (\text{Assignment 1}) + 0.25 \cdot (\text{Assignment 2})$
