

12998-314(16) Statistical Physics A (Introductory Thermodynamics and statistical mechanics) (3l, 3p)

2015

Course summary:

The three laws of thermodynamics are formulated, analysed and applied to simple thermodynamical systems; statistical and thermodynamic functions; phase equilibrium; statistical basis of thermodynamics. Fermi and Bose statistics, the ideal gas, black body radiation and other applications.

Continuous assessment
P Physics 254
P Mathematics 214, 244

Outcomes of course:

The course establishes a basic working knowledge of thermodynamics, statistical mechanics, their relation and applications. Given the central role of thermodynamics and statistical mechanics in physics and physical applications, it is a core course on which many other applications build. It also lays the foundations for more advanced courses in statistical physics.

Lecturers:

Prof. KK Müller-Nedebock

Telephone number: (021) 808-3386
E-mail address: kkmn@sun.ac.za
Office: Room 1027 in the Merensky Physics Building

Prof. EG Rohwer

Telephone number: (021) 808-3372
E-mail address: egr@sun.ac.za
Office: Room 1009 in the Merensky Physics Building

Course content:

The laws of thermodynamics are formulated, analysed and applied to simple thermodynamic systems. An early emphasis is put on the statistical basis of entropy and the partition function to serve as a link between statistical physics and thermodynamics. Applications are made to the classical ideal gas, the ideal quantum gas, paramagnetic systems, heat engines, refrigerators and phase transformations. In particular the Clausius-Clapeyron relation and van der Waals model are discussed. Boltzmann statistics and its applications are studied in detail. In conjunction with the Gibbs factor this background is used to introduce the quantum statistics of bosons and fermions. Applications include the ideal Fermi gas, black body radiation, the Debye theory of solids and Bose-Einstein condensation.

Practical (Tutorials):

1 Tutorial every week as per schedule provided at start of course

Study material:

DV Schroeder, *An Introduction to Thermal Physics* (Addison-Wesley, 1999)

Learning opportunities:

3 Lectures per week

Assessment:

Methods of Assessments

Continuous Assessment

Venue and time of assessment opportunities

Merensky Building

Test schedule: See ***timetable*** on Physics home page

Availability of marks:

2 weeks after test

Calculation of final mark for the module:

25% Tasks,

25% Tutorial tests,

25% Test 1,

25% Test 2
