# Forest measurement evolution

1. Stand level: Sampling (3%)
  - a) Traditional technology
  - b) Non-spatial
2. Stand level: Full census – Transition
  - a) Contemporary technology, traditional concepts
  - b) Semi spatial
3. Sub stand level: Full census
  - a) Contemporary technology, contemporary and traditional concepts
  - b) Fully spatial

# Ground-based enumeration

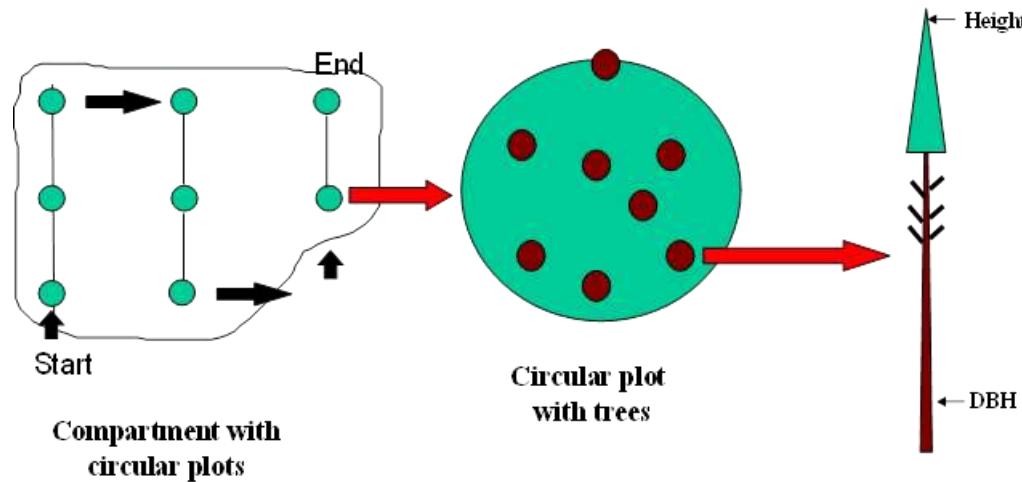

Traditional forest measurement

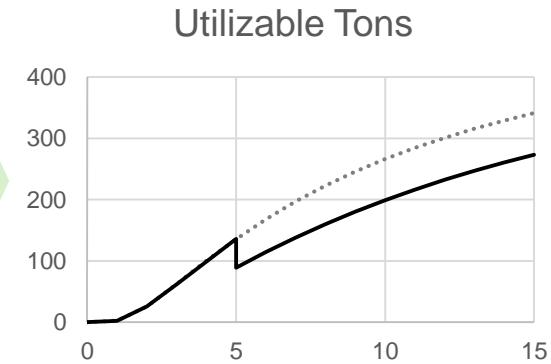

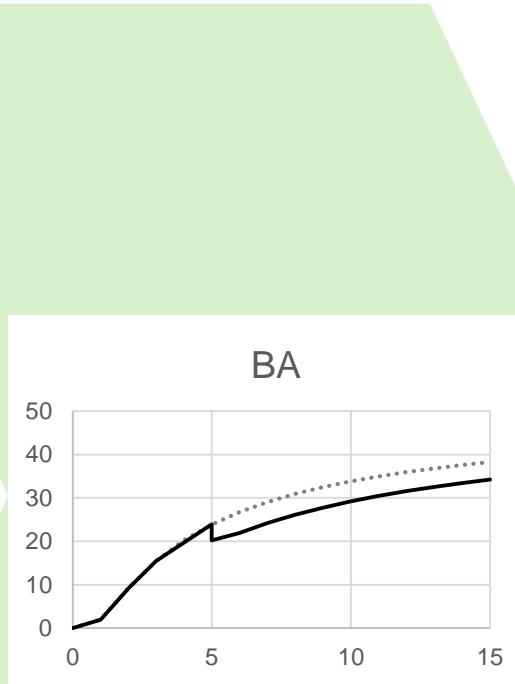

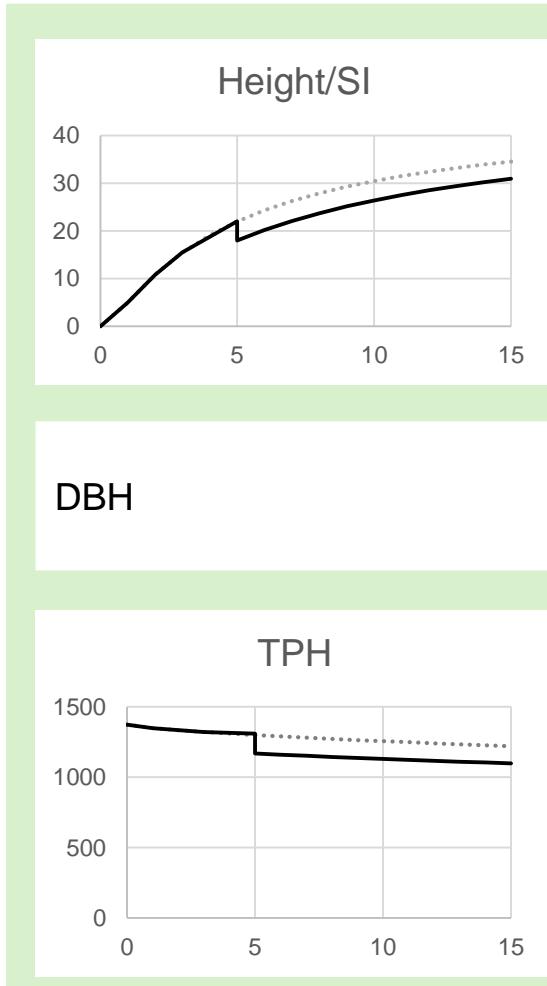

# Ground-based enumeration

## Stand level: Sampling (3%)

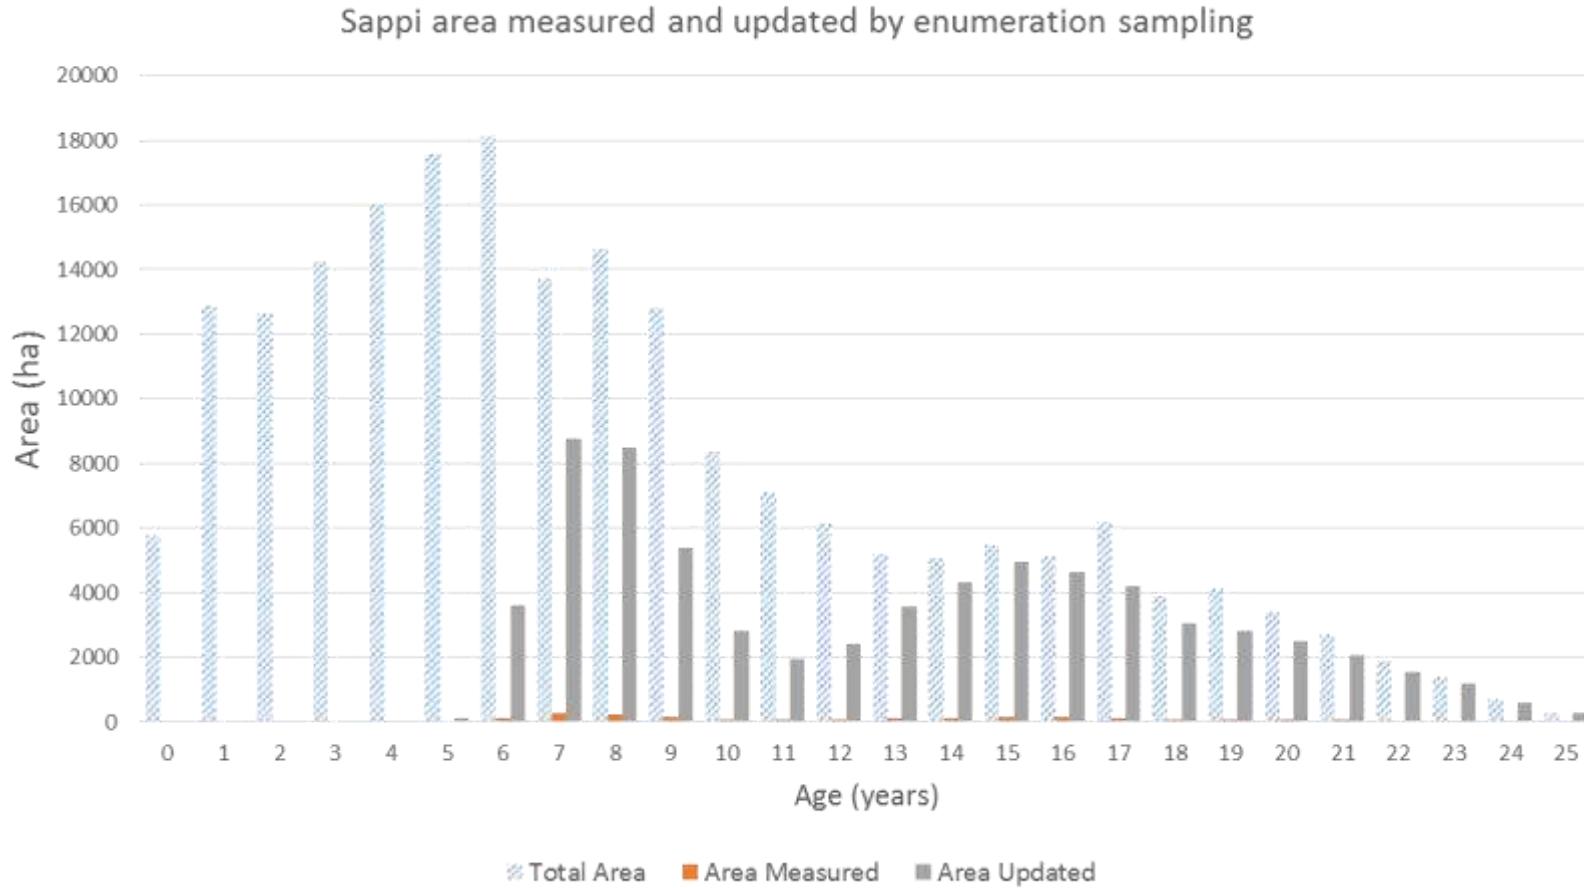

- a) Traditional technology
- b) Non-spatial

# Empirical growth modelling

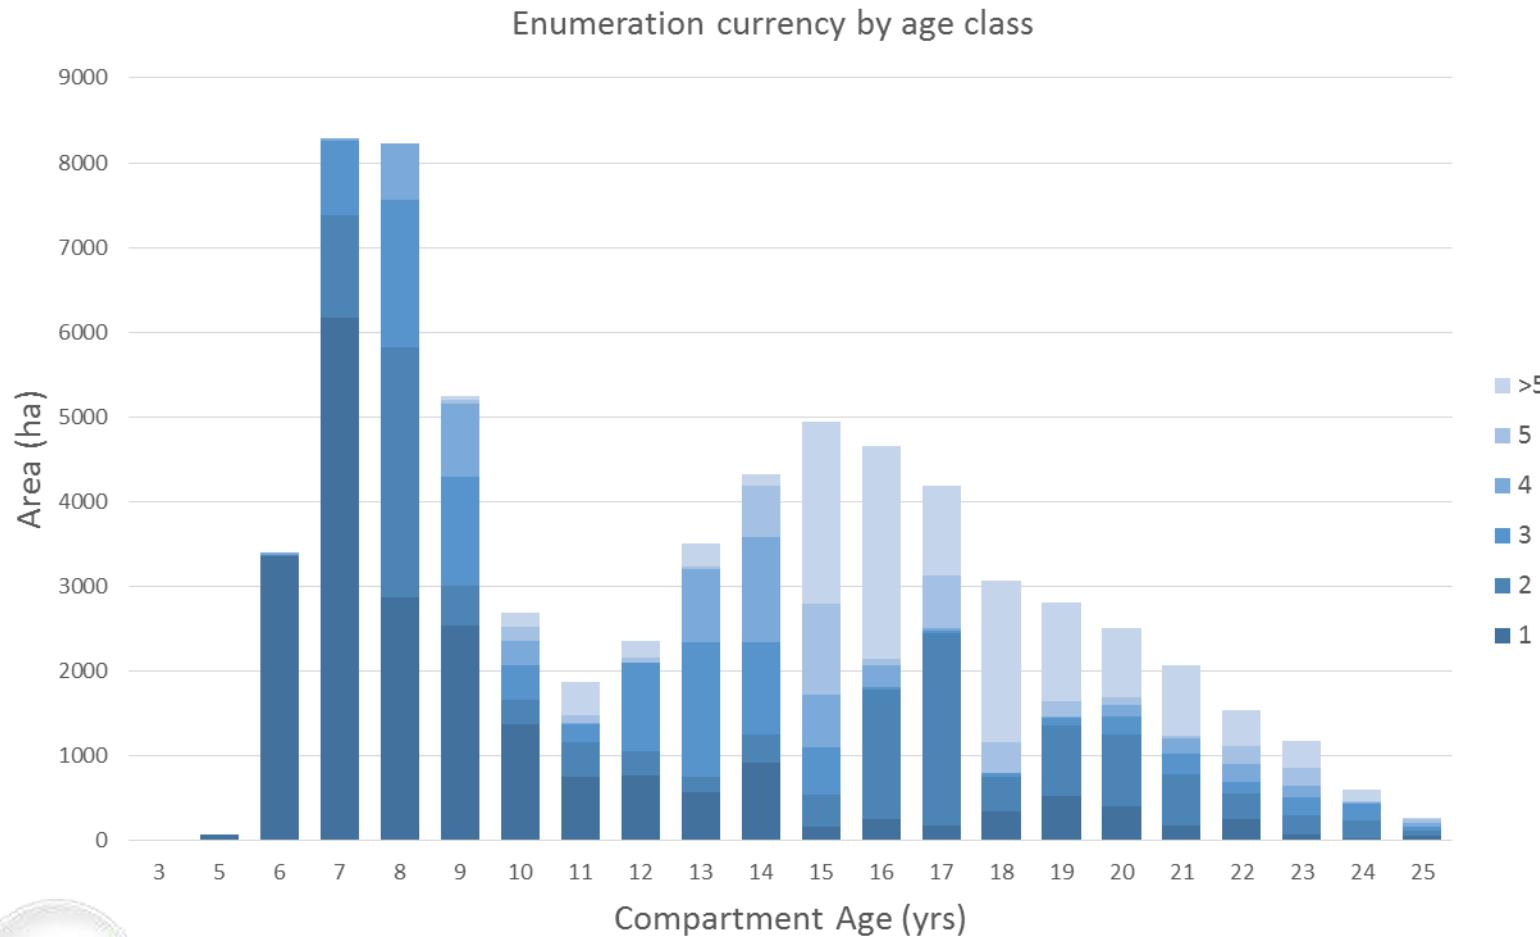

# Stand level: Sampling

# Stand level: Enumeration sampling

Age of enumeration data

# Stand level LiDAR measurement

Canopy height model

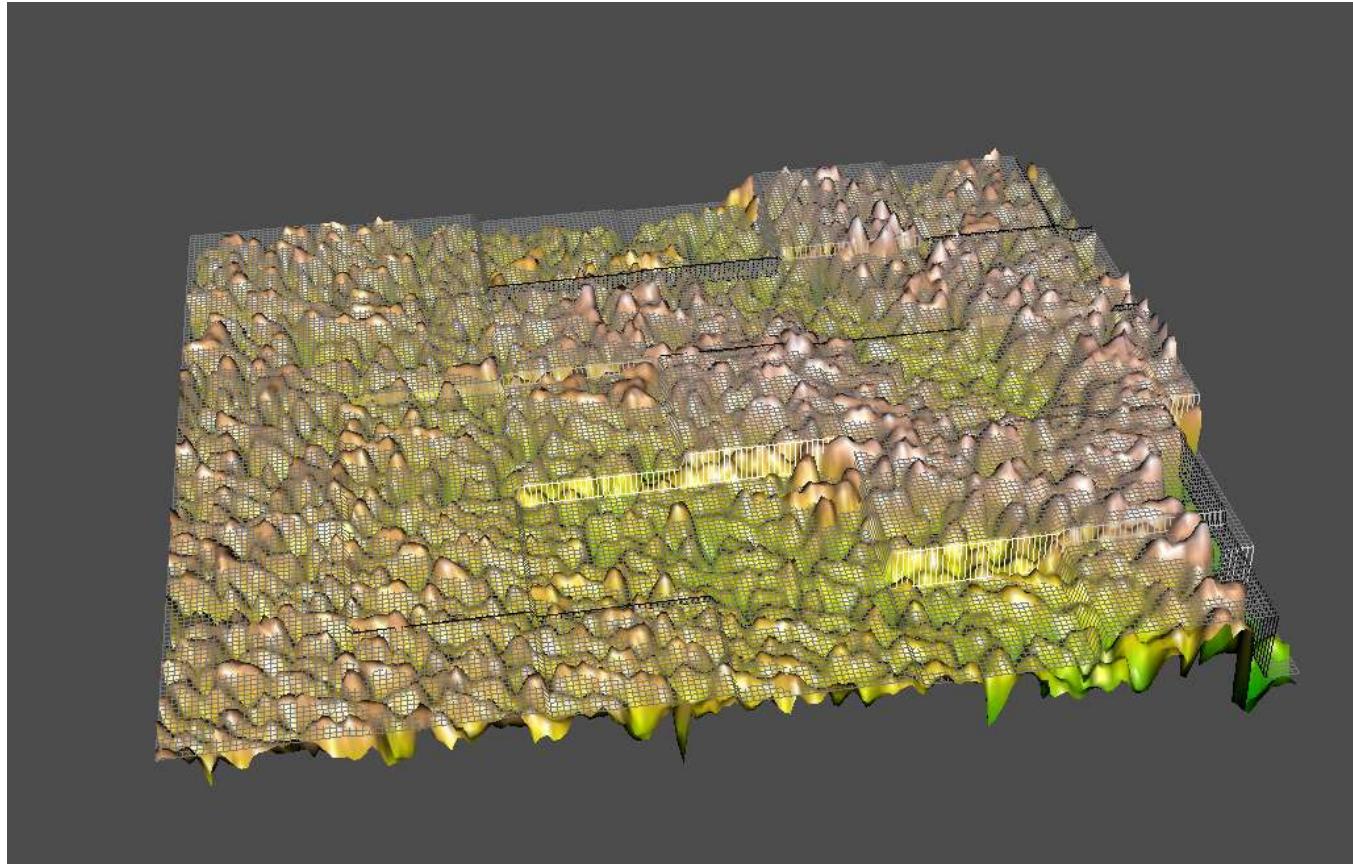

# Stand level LiDAR measurement

Pixel percentile value

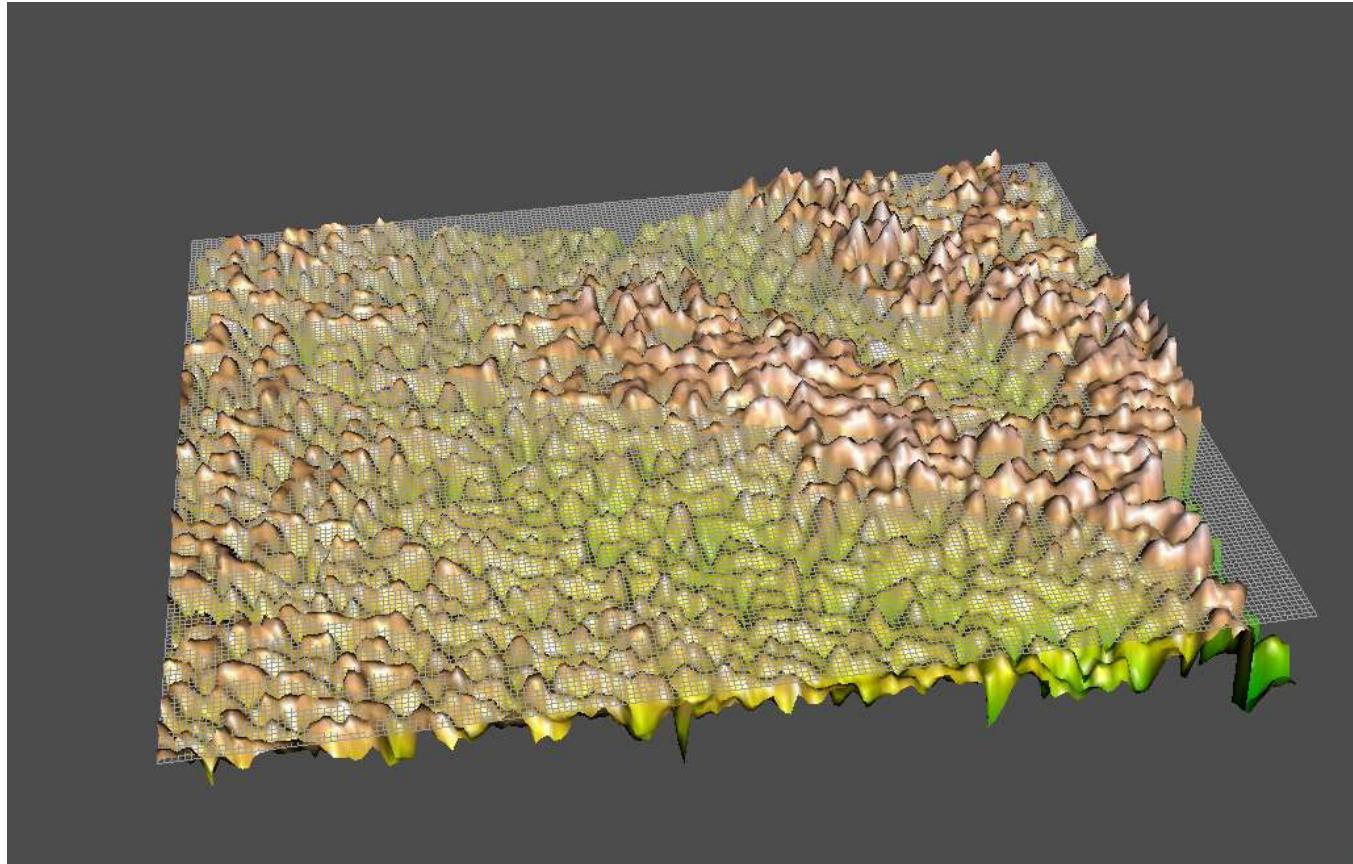

# Stand level LiDAR measurement

Pixel percentile value

# Stand level LiDAR measurement

Mean stand height

# LiDAR Height/SI

## Update classes:

1. Young (Eucalyptus < 3, pine < 7 years)  
Site Index update from updated SI map
2. Previously enumerated  
Update of height from LiDAR
3. Older (Eucalyptus > 3, pine > 7 years), non-enumerated compartments  
Update of Site Index from LiDAR

# Example of SI differences before and after update

Relative change in SI. Red shows decrease, green shows increase.

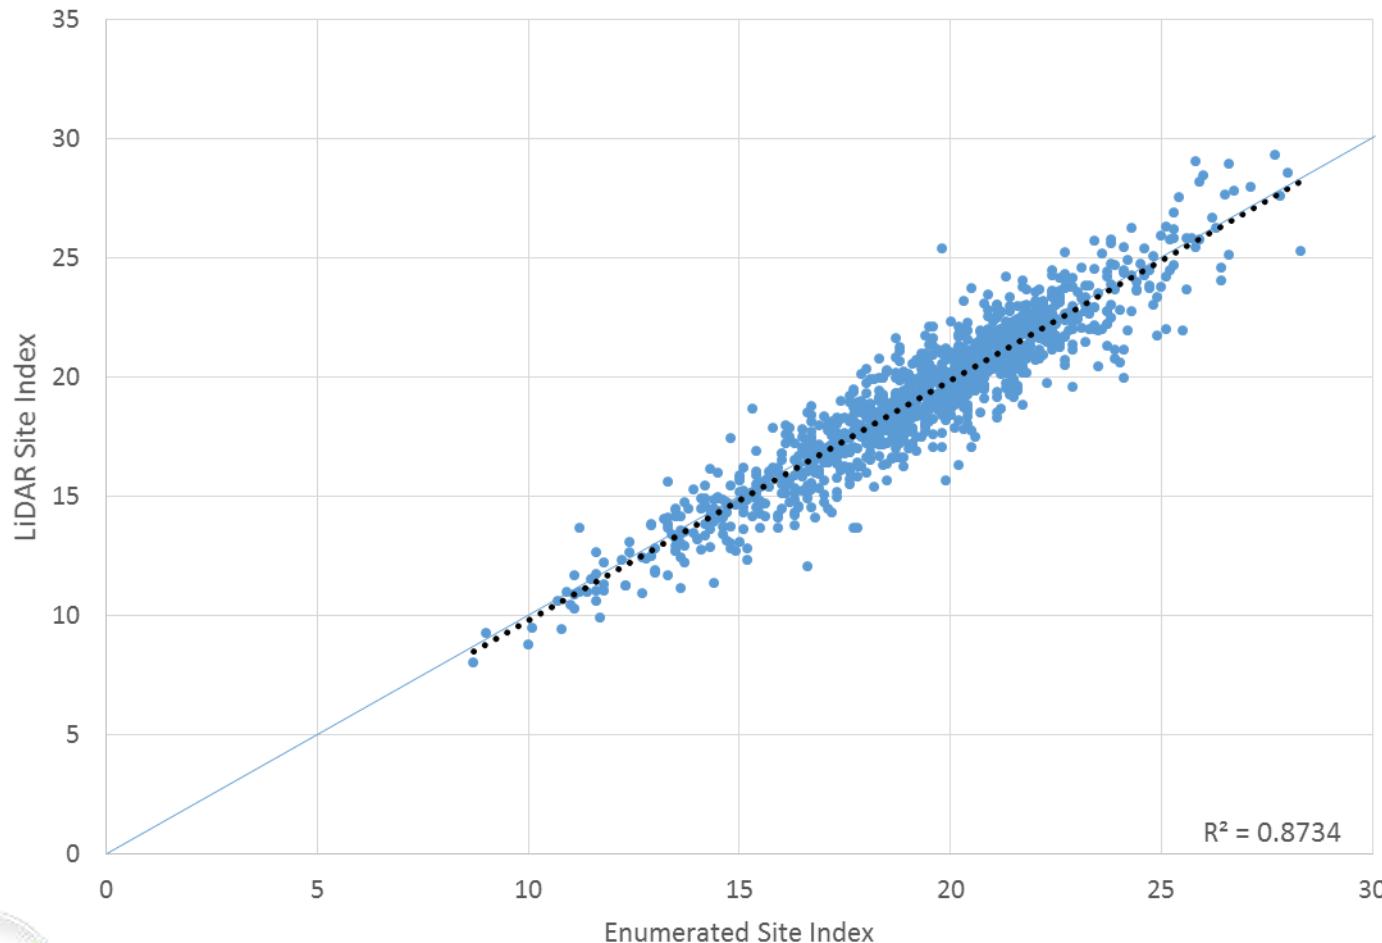

sappi

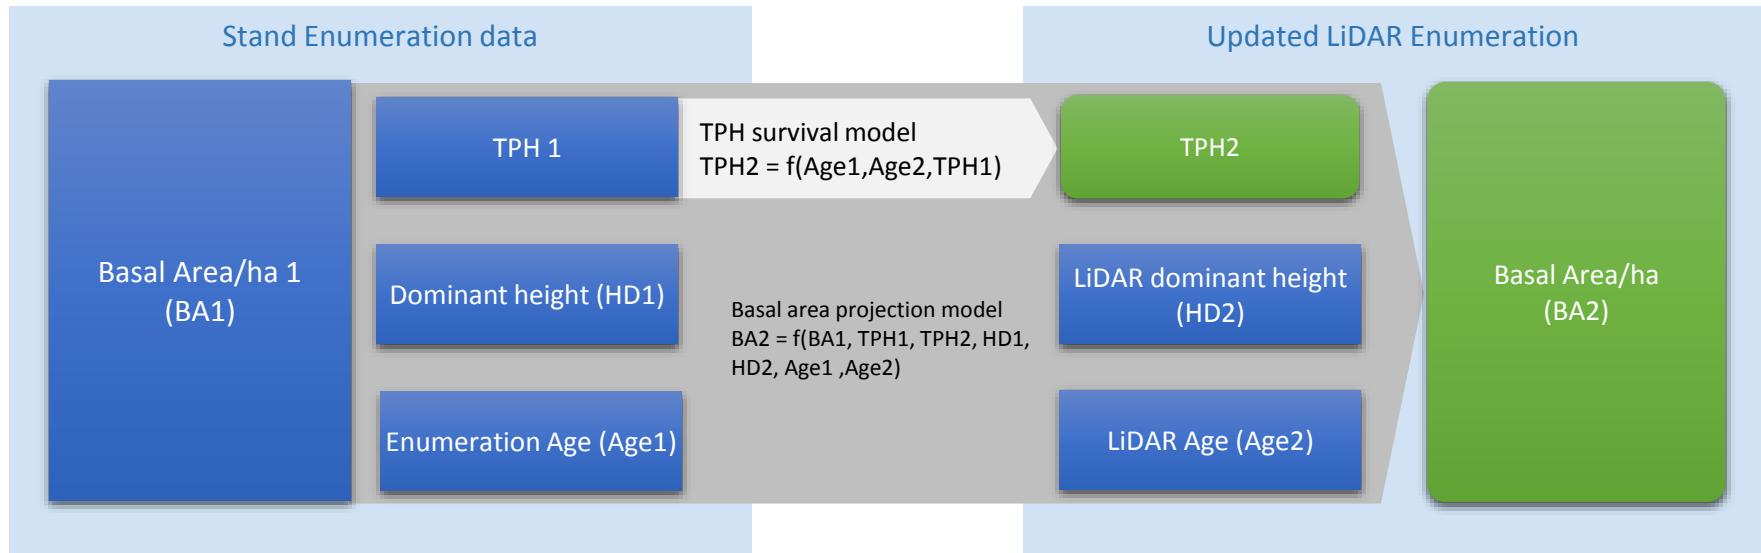

Source: Hlelo plantation. Sappi LiDAR updates 2016

# Stand level SI comparison

All species, enumeration <5 years before LiDAR

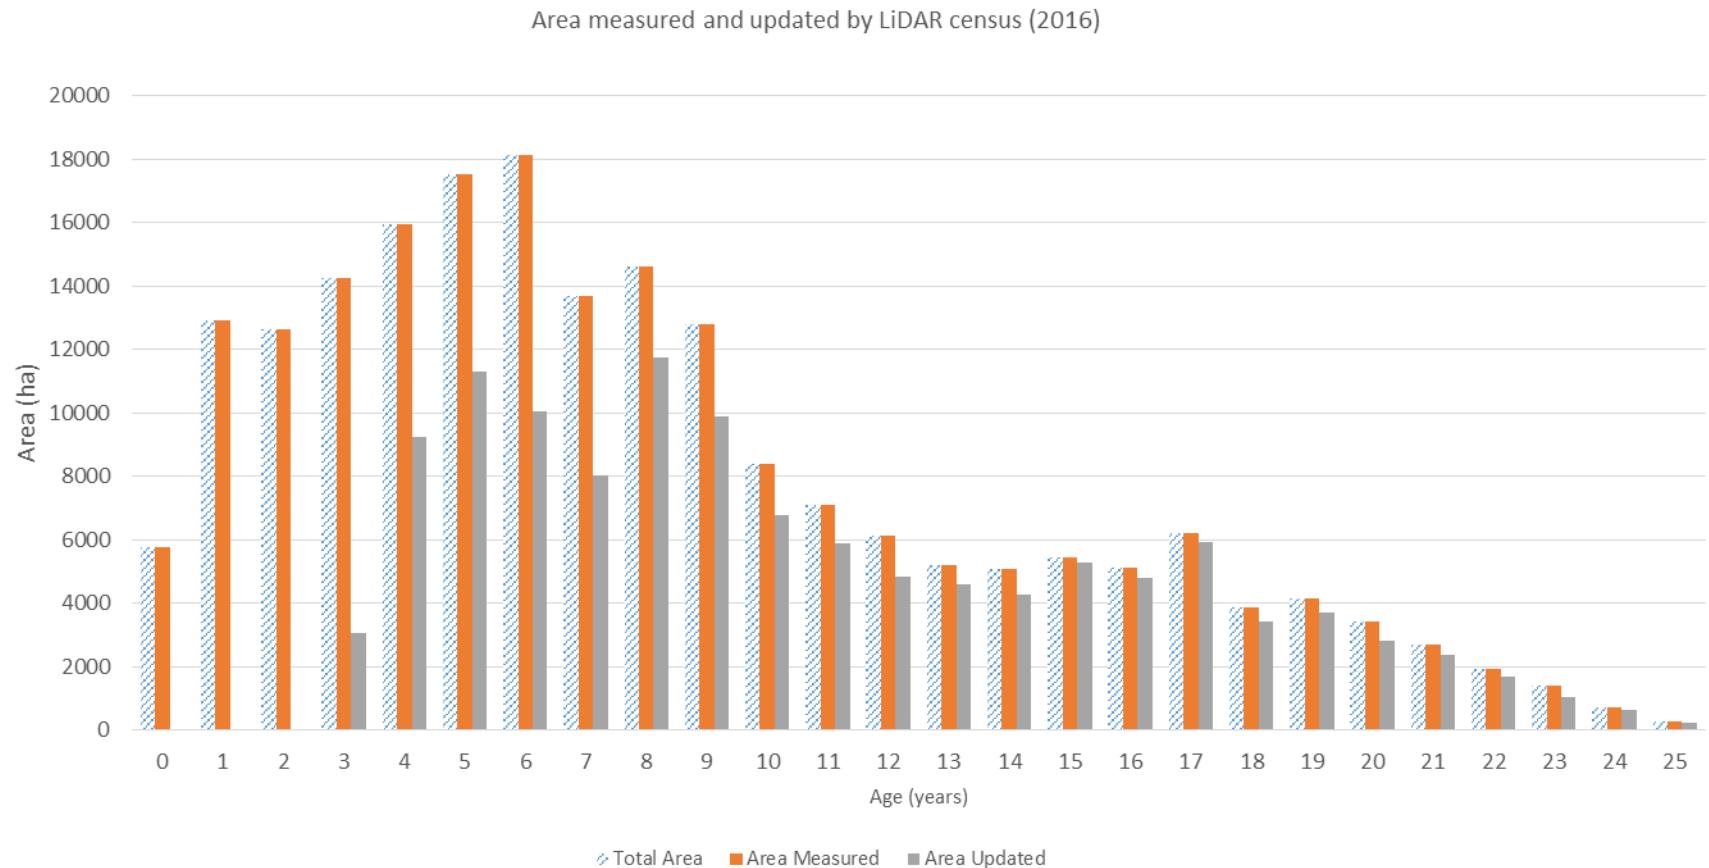

# Basal area update (Previously enumerated)

# Stand level LiDAR coverage

Data measured and updated in 2016

# Sub stand level LiDAR measurement

# Sub stand level LiDAR measurement

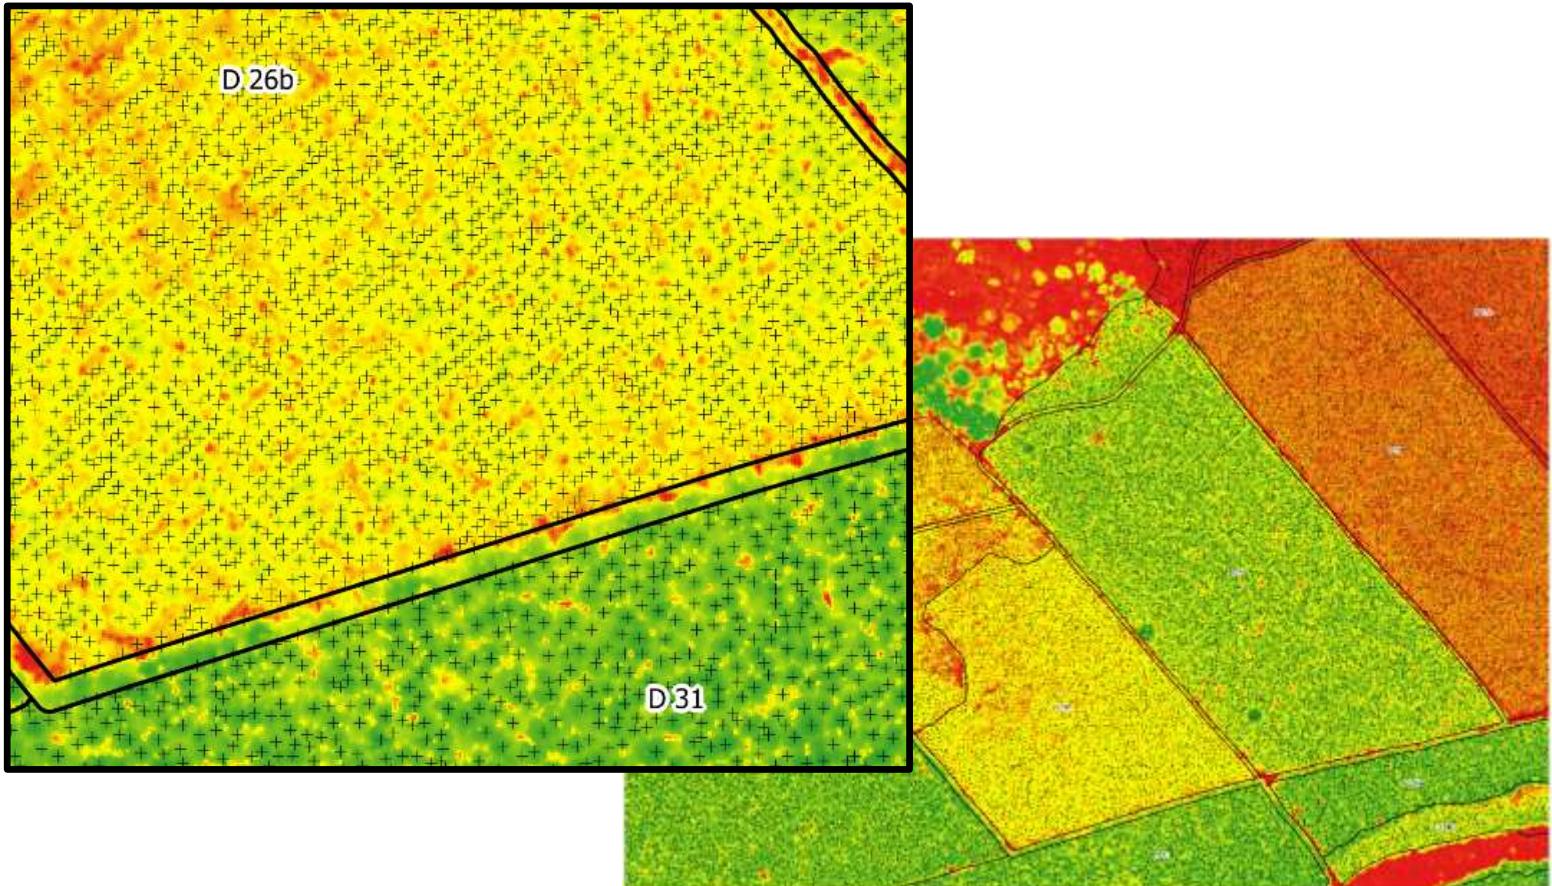

## Sub stand level: Full census

- a) Contemporary technology, contemporary and traditional concepts
- b) Fully spatial

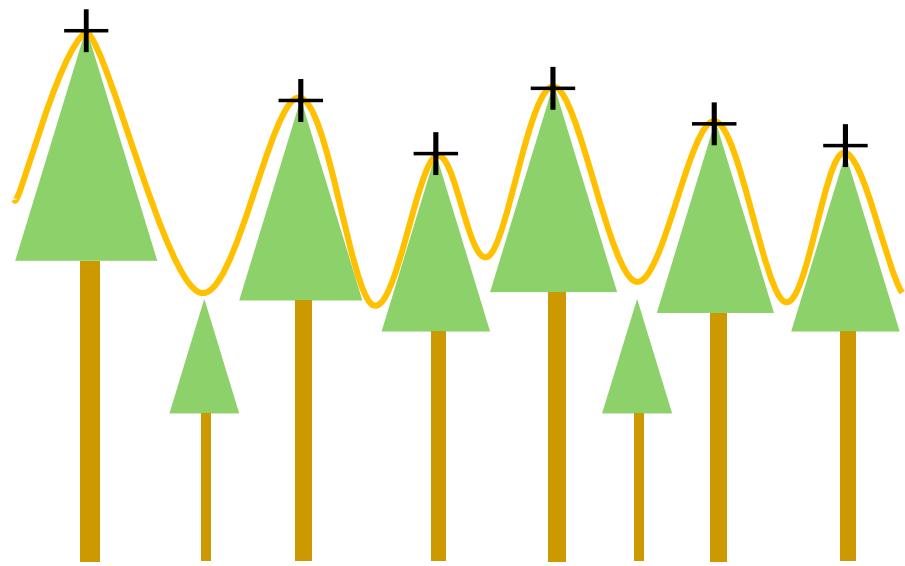

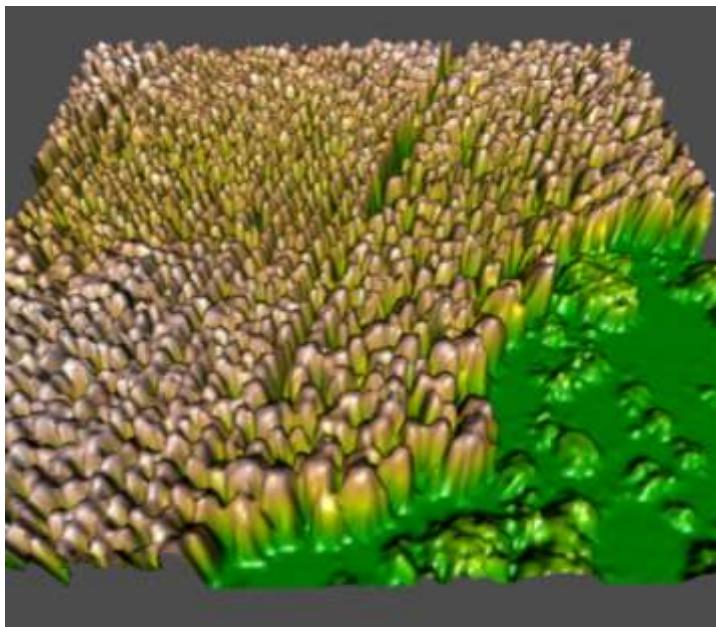

# LiDAR TPH

1936  
2016  
89

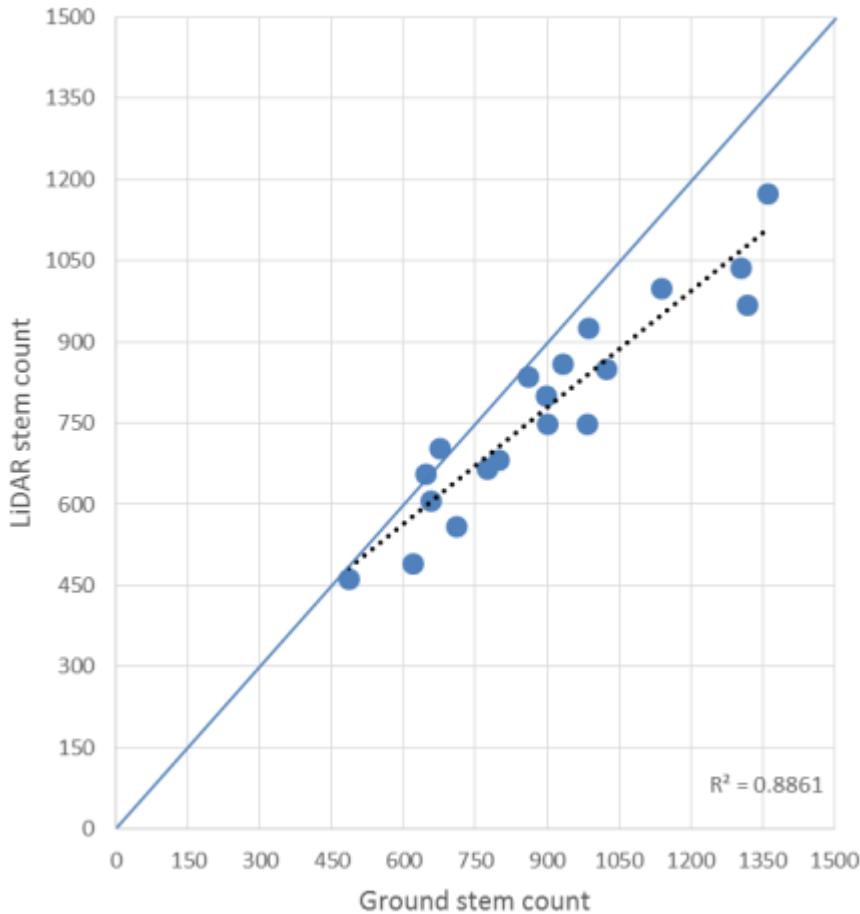

# LiDAR stem count adjustment

CHM Underestimate

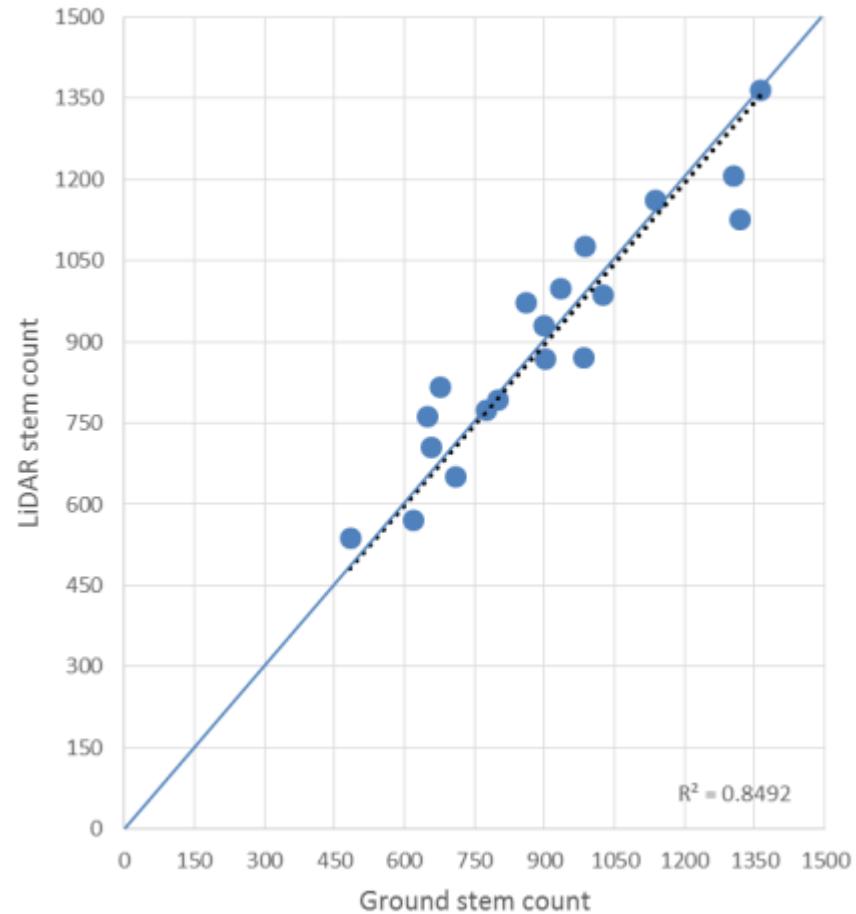

# LiDAR stem count Adjustment

Stem count before adjustment

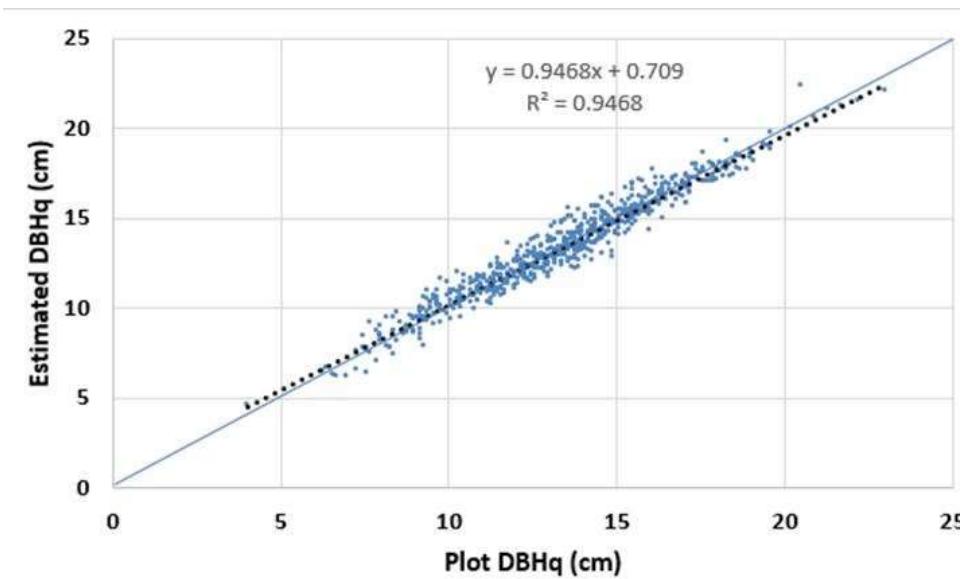

Stem count after adjustment

# LiDAR DBH estimate

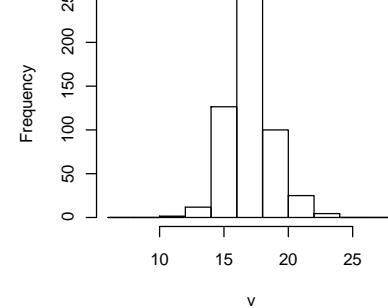

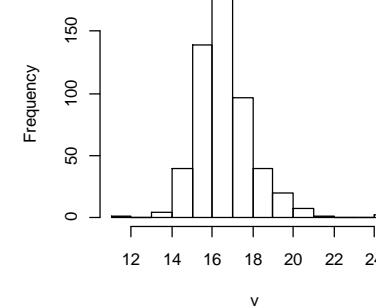

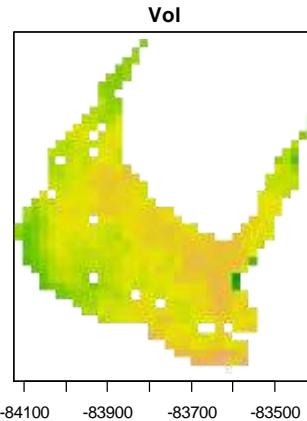

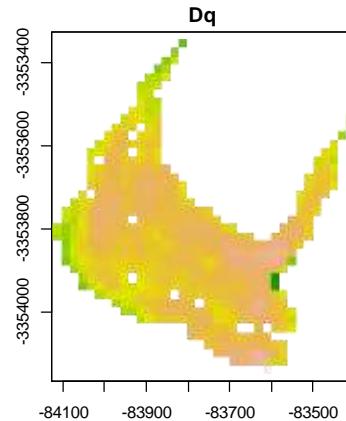

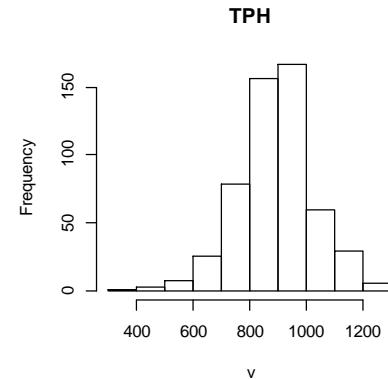

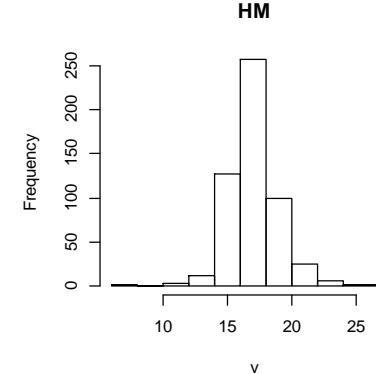

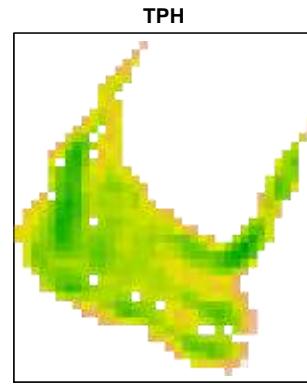

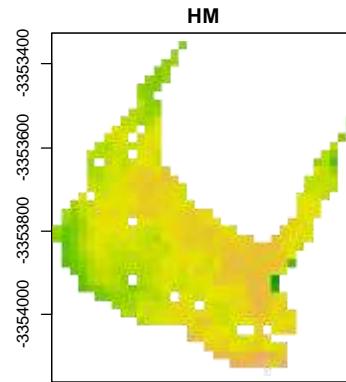

Output based on PSP data inputs (Not LiDAR measurements)

- Fitting of beta functions per species/region based on PSP and other enumeration data (include site variables).
  - $\text{DBH} = f(\text{LiDAR height, LiDAR TPH, Beta})$

# LiDAR measurement outputs

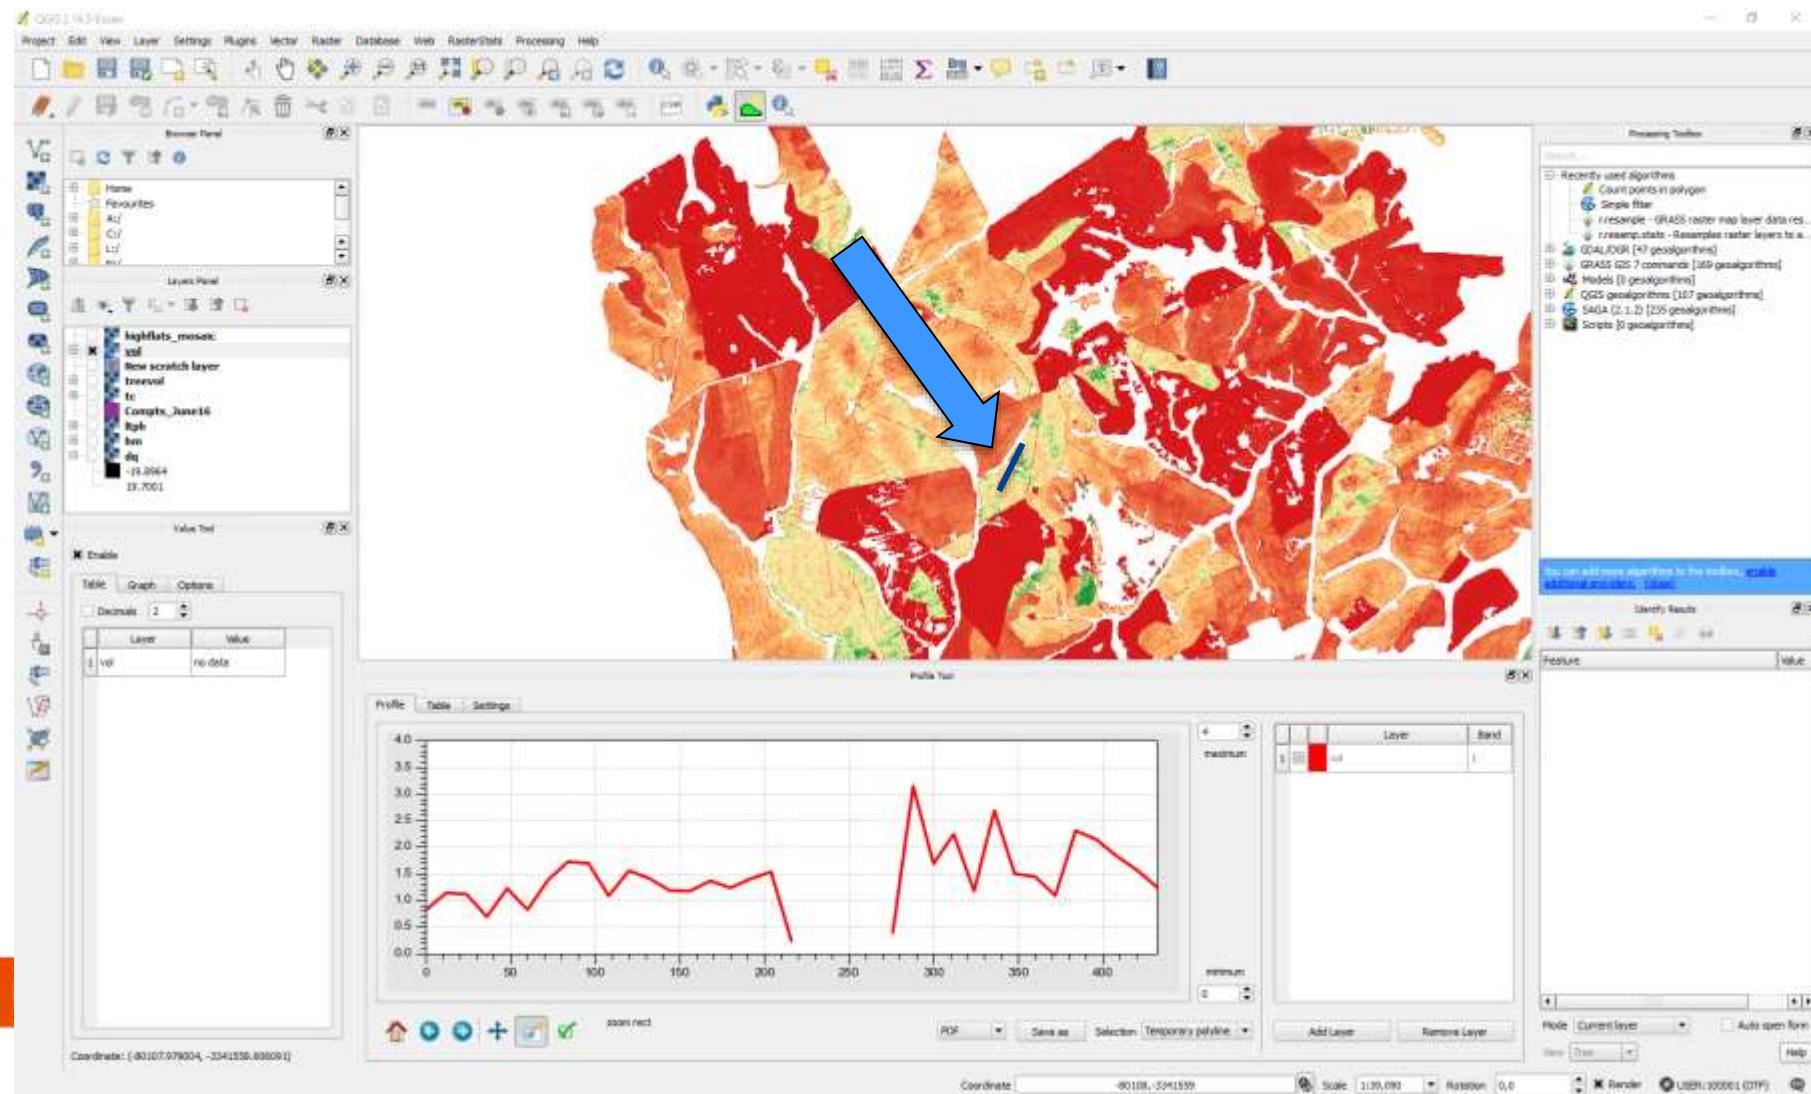

## Pixel level forest measurement

LID	HM	TPH	Dq	Vol
1097440	17.08	894	16.59	9084.89

# LiDAR measurement outputs

## Pixel-level forest measurement

# Conclusion

# Plantation growing stock variables

Full coverages

Variable	LiDAR		Enumeration	
Plantation level				
Coverage	100% (max 2 year old data)		30% (1-8 year old data)	
Compartment level				
	Sample % Area	Data source	Sample % Area	Data source
Height/SI	100%	Direct	<3%	Direct
TPH	100%	Adjusted	<3%	Direct
Diameter	100%	Derived	3%	Direct
Volume	100%	Derived	3%	Derived
