

Prof Alex van den Heever

Future Proofing the South African Health System

- All systems are governed by their responses to internal and external pressures
- How responses are weighted depends on the extent to which any of these pressures threatens the survival or promotes the flourishing of individuals that form part of a system
- Most systems that we can relate to are the organisations we form part of even though organisations form part of wider systems

Economics refers to three forms of efficiency important to optimise

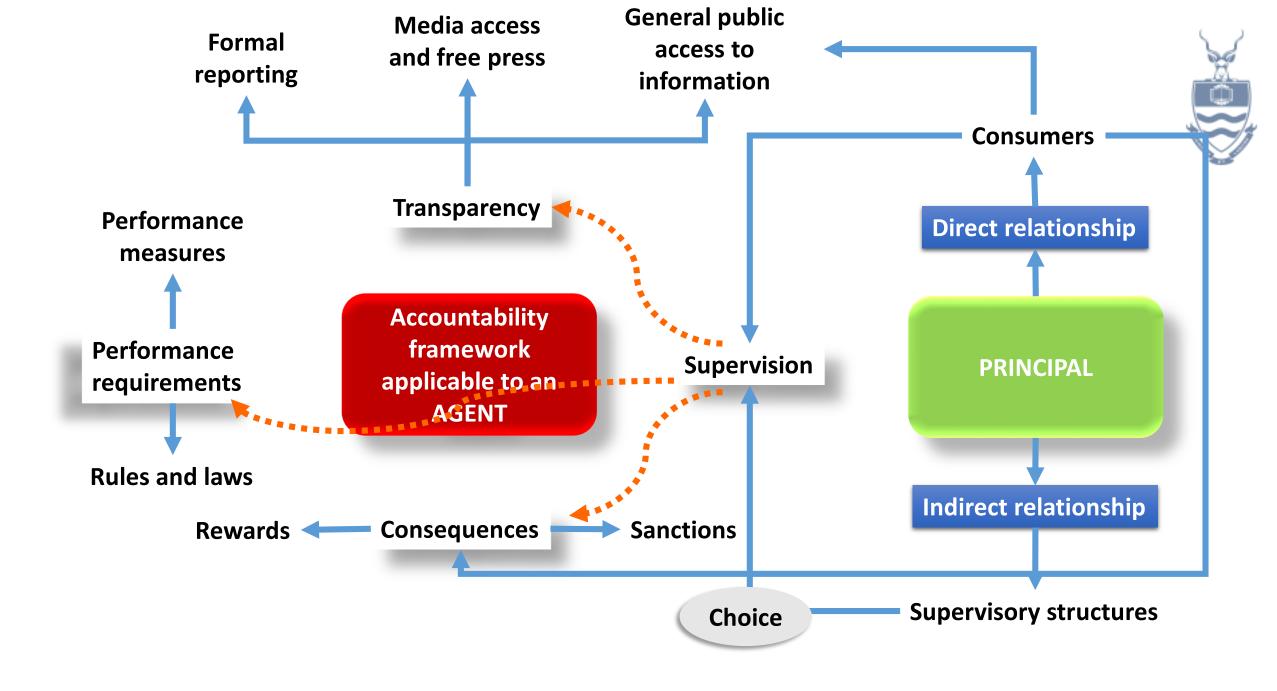

- Technical efficiencies (optimal use of resources)
- Allocative efficiencies (goods and services distributed in accordance with preferences (individual) and/or need (social preferences)
- Dynamic efficiencies (innovation)

Well-designed organisations internalise their responses to internal and external pressures such that they optimise all three forms of efficiency in realising their organisational purpose

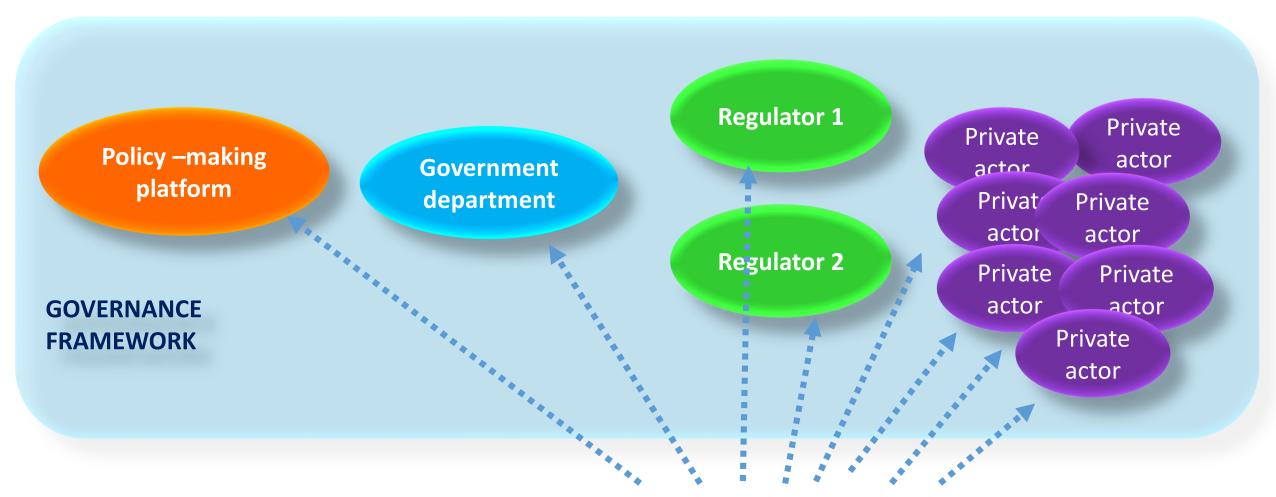

Accountability regimes, the direct effects of which are highly localised, are used to internalise responses to internal and external pressures in relation to a set of objectives and goals that define the organisation or system

Governance frameworks and accountability frameworks

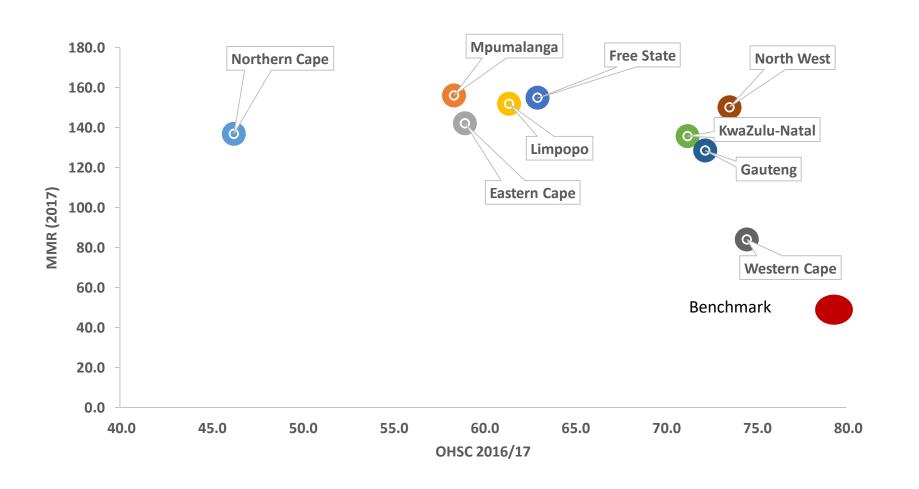

Dedicated accountability structures

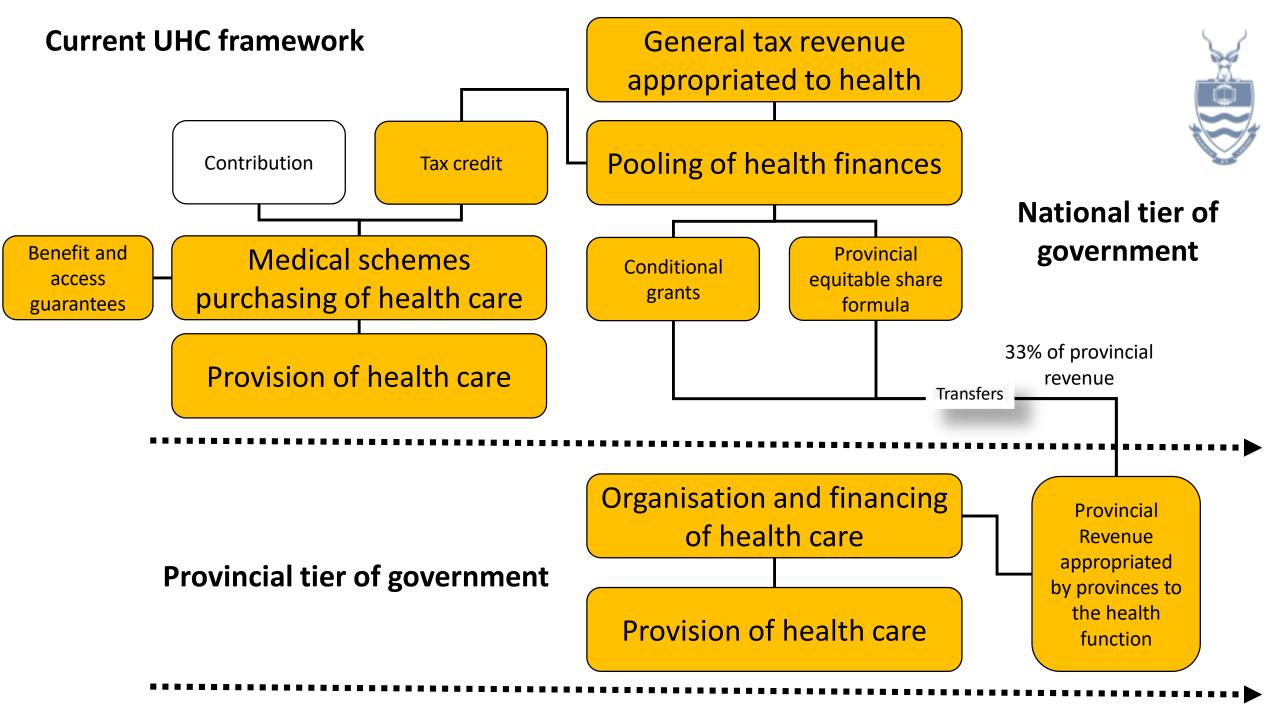

Maternal mortality ratios and the results of the OHSC hospital audits

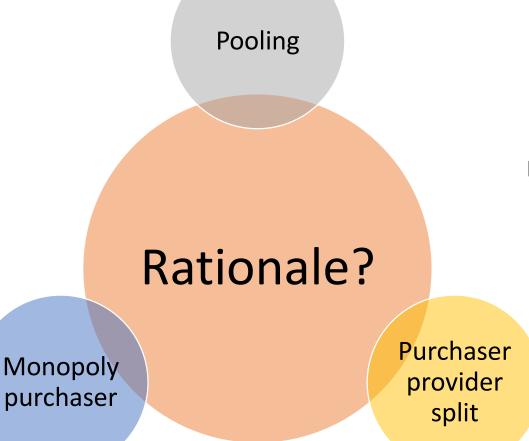

The MMRs are structurally worse in the ANC-run provinces

As are the OHSC reviews

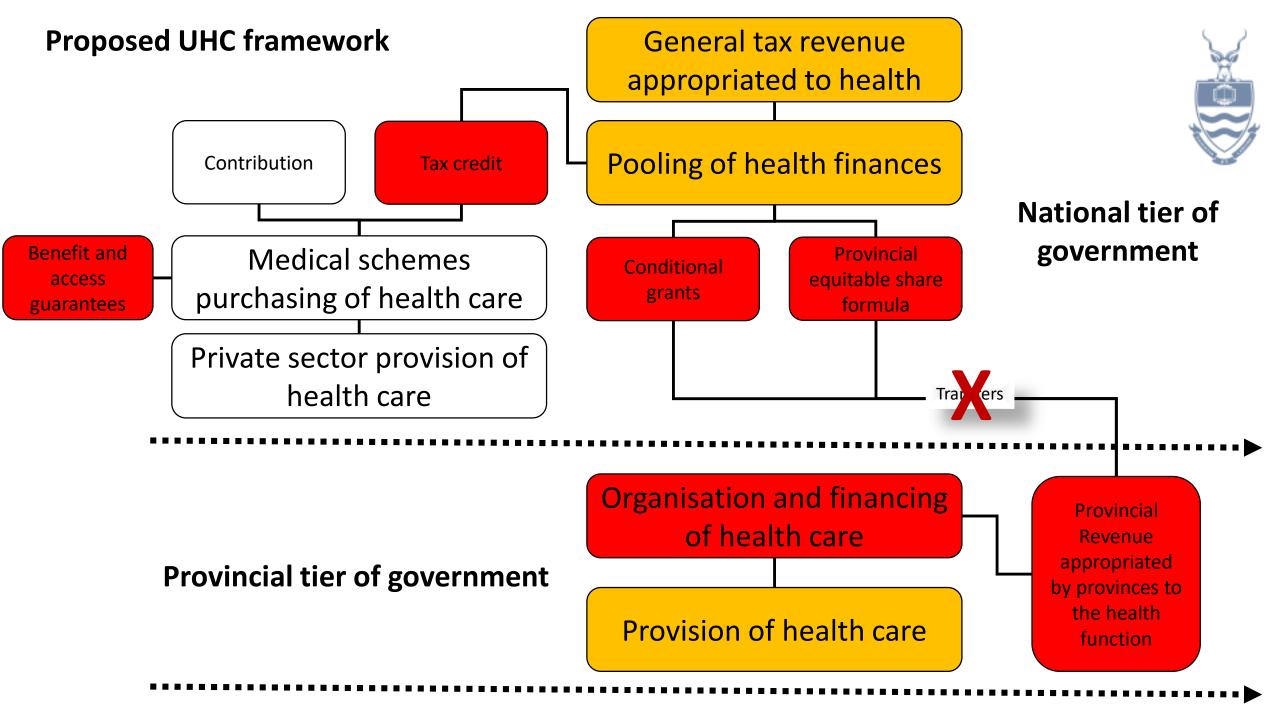

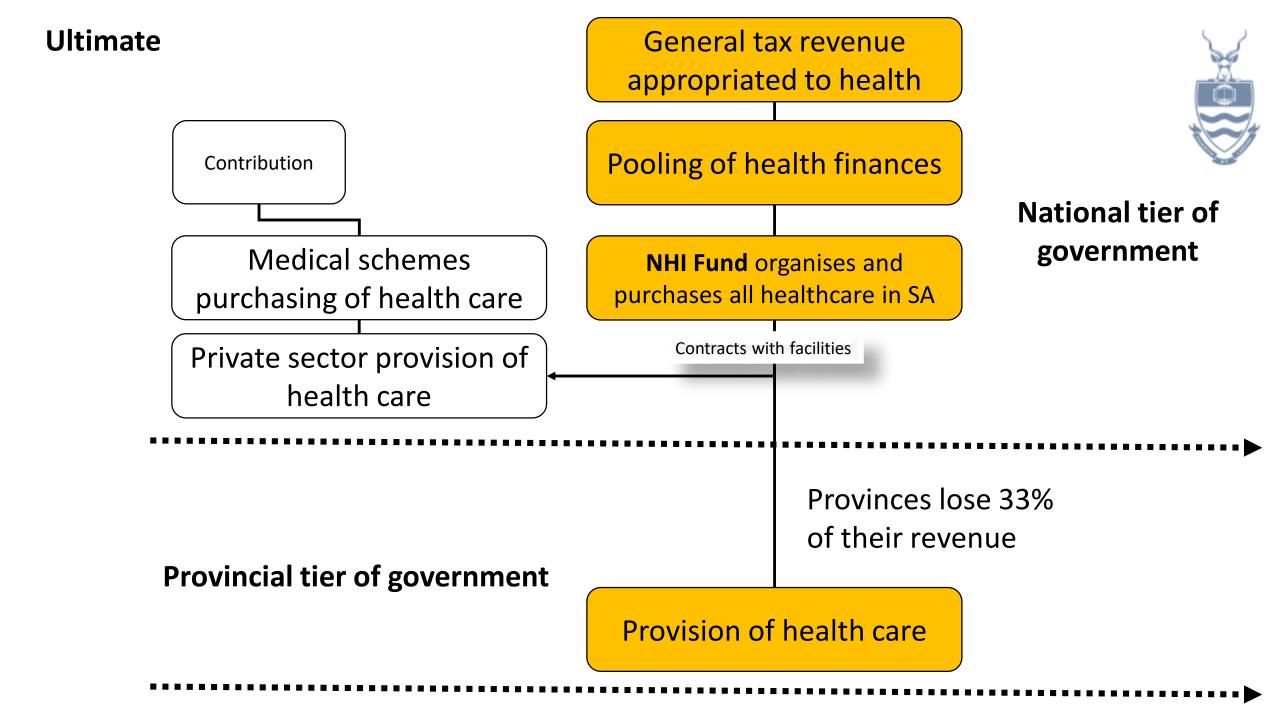

What is the rationale for the proposal

Note that no
evidence/report/feasibility
study of any form has been
produced to clarify the causes
of weaknesses in the health
system and their relationship
to proposed reforms

Thank you
