## HEALTH RESEARCH ETHICS COMMITTEE (HREC)

## **Guideline for Paediatric Blood Volume for Research Purposes**

Amended Document prepared by M Kruger

30 November 2015 V1.1

## **Public guideline**

The following is the guideline for the SOP for researchers which should be available on the website:

- It is important to take the child's clinical condition into account when determining what volume can be used for research purposes.
- Blood volume should not exceed 5% of the total blood volume during a one-off sampling of total blood volume (including routine blood specimens for clinical care).
- Blood volume should not exceed 5% of the total blood volume within 3-months (including routine blood specimens for clinical care). (US OHRP: 3 ml/kg or up to 50 ml total within 8 weeks).
- If the blood volume necessary exceeds the above guideline, the research team need to submit additional motivation, which will be considered by the ethics review committee for final approval and may need expert opinion to guide the ethics review committee.

## **REC Member guideline**

This guideline is to be used by REC members when there is a request for a larger blood volume to be taken from a child participant with adequate motivation by the principal investigator. This guideline also take into consideration the haemoglobin and is therefore a better guideline in the scenario dealing with impoverished communities and malnutrition.

| CMRC IRB MAXIMUM ALLOWABLE TOTAL BLOOD DRAW VOLUMES (CLINICAL + RESEARCH) |         |             |                         |                            |            |                  |  |
|---|---------|-------------|-------------------------|----------------------------|------------|------------------|--|
